AB The present invention relates to cell culture. In particular, this invention is directed to methods and apparatuses used to observe or quantitate cell proliferation in the presence of potential growth promoting mols. in a two or three dimensional architecture. Further, the invention provides methods, apparatuses and kits which can be used in assays for the effects of different materials, bioactive agents, or combinations thereof on cells in two or three dimensional culture. In particular, the invention provides a method for determining the presence or absence of respiring cells which includes depositing a three-dimensional biomimetic scaffold and cells onto a sensor composition, the sensor composition including a luminescent compound that exhibits a change in luminescent property when irradiated with light containing wavelengths which cause said compound to luminesce upon exposure to oxygen and then irradiating the sensor composition with light to cause luminescence, followed by determining

the

resultant luminescent light intensity emitted and determining whether said resultant luminescent light intensity emitted is indicative of the presence or absence of respiring cells. The system also can be used in cytotoxicity assays for the effects of drugs, toxins, or chems. on eukaryotic or prokaryotic cells.

AB The present invention relates to methods for detection and evaluation of metabolic activity of eukaryotic and/or prokaryotic cells based upon their ability to consume dissolved oxygen. The methods utilize a luminescence detection system which makes use of the sensitivity of the luminescent emission of certain compds. to the presence of oxygen, which quenches (diminishes) the compound's luminescent emission in a concentration dependent manner. Respiring eukaryotic and/or prokaryotic cells will affect the oxygen concentration of a liquid medium in which they are immersed. Thus, this invention provides a convenient system to gather information on the presence, identification, quantification and cytotoxic activity of eukaryotic and/or prokaryotic cells by determining their effect on the oxygen concentration of the media in which they are present.

 NOVELTY - Detection of oxygen consumption in test sample includes exposing
 test sample and control sample to sensor composition, determining signal

strength generated by the sensor composition at time intervals, and comparing the strengths of signals generated from the sensor composition exposed to test sample with the signals generated by the sensor composition exposed to control sample, and determining whether oxygen in test sample has been consumed.

DETAILED DESCRIPTION - Detection of oxygen consumption in a test sample includes exposing a test sample and a control sample to a sensor composition comprising a luminescent compound that is inhibited from generating detectable signal in the presence of inhibitory amount of oxygen and generates detectable signal as the inhibitory amount of oxygen is reduced; determining the strength of signals generated by the sensor compositions at time intervals; and comparing the strengths of signals generated from the sensor composition exposed to the test sample with the signals generated by the sensor composition exposed to the control sample over the time intervals, and determining whether oxygen in the test sample has been consumed.

An INDEPENDENT CLAIM is also included for an article of manufacture comprising a computer usable medium, a computer readable code embodied on the computer usable medium for detecting oxygen consumption in a test sample and designed to receive signals generated at time intervals by a sensor composition, and computer readable program code devices designed to cause the computer to effect the comparing of the strengths of signals generated from the sensor composition exposed and determining whether oxygen in the test sample has been consumed.

USE - For detecting oxygen consumption in test sample, e.g. biological sample.

ADVANTAGE - The inventive method enables similar fluorescent signals from control and test samples to be distinguishable, so that over time, once can assess whether or not oxygen consumption occurring in a test sample is different from that occurring in a control sample.
